

Practice Customer Engineer, AI (GE) Google Interview Presentation Prompt

We're excited you've reached the Presentation stage of the **Practice Customer Engineering** interview process. The content below provides background information, instructions, assessment details and best practices for your presentation. For questions regarding your interview schedule, please contact your Recruiter.

Background

The **Practice Customer Engineer** serves as a domain expert responsible for accelerating technical wins and adoption of complex, specialized workloads. You will leverage your deep expertise in our most strategic product areas to be hands-on developing prototypes, proofs-of-concept, and demos to sell new, highly specialized solutions to customers. You will solve practice-specific customer challenges and provide a critical feedback loop to influence customers and product development.

In this 45-minute, 1:1 interview, you'll be assessed on your domain-specific technical acumen, consultative skills, and your ability to deliver a targeted presentation of your choosing. You will spend **30 minutes presenting** and **10-15 minutes of Q&A** regarding your presentation content.

Assessment

The purpose of this part of the interview process is to assess your ability in the following areas:

- Domain-specific technical acumen
- Hands-on keyboard skills
- Identifying customer solutions
- Engaging with your audience
- Conveying measurable business value
- Effectively handling questions

The Prompt

A multinational bank with 80,000 employees across 40 countries is struggling with knowledge fragmentation. Institutional knowledge is scattered across dozens of systems, and finding information is a significant productivity drain.

The 'new employee problem': A new hire takes 6+ months to become fully productive because they can't find information. Common frustrations:

- Where is the policy on client gift limits?' (Answer: Buried in a 200-page compliance PDF in SharePoint)
- Who approved the exception for the Smith account?' (Answer: In a ServiceNow ticket from 2 years ago)
- What's the process for requesting trading system access?' (Answer: In Workday, but under a non-intuitive category)

Current systems and their challenges:

System	Data Type	Users	Authentication	API
ServiceNow	IT tickets, change requests, knowledge base	80,000	Okta SSO	REST API with OAuth
Workday	HR policies, org charts, PTO, payroll	80,000	Okta SSO	SOAP/REST with OAuth
Compliance System (proprietary)	Trading rules, regulatory filings, audit logs	5,000 (trading floor)	LDAP + 2FA	Legacy SOAP, no modern auth
SharePoint (legacy)	Department documents, policies, procedures	60,000	Azure AD (federated to Okta)	Microsoft Graph
Confluence	Technical documentation, runbooks	15,000 (IT/Ops)	Okta SSO	REST API

The security complexity: This is a bank—access control is not optional, it's legally mandated:

- **Chinese wall:** Investment banking employees cannot see trading floor communications about certain clients
- **HR confidentiality:** Only HR and direct managers can see performance reviews
- **Regulatory:** Compliance documents have specific access lists; audit logs must show who accessed what
- **Geographic:** EU employees' data must comply with GDPR; some data cannot be processed in US datacenters

Specific access control scenarios to handle:

1. A trader searches 'client gift policy'—they should see the trading-specific policy, not the investment banking version

2. An HR manager searches 'termination process for John Smith'—they should see relevant HR docs only for their direct reports
3. A compliance officer searches 'trading violations'—they should see audit logs, but not HR files about the traders involved
4. An IT support tech searches 'password reset'—they should see ServiceNow knowledge articles, not Workday admin procedures

The customer wants Gemini Enterprise / Agentspace that:

1. Provides unified natural language search across all 5 systems
2. Respects existing access controls—users see only what they're authorized to see in source systems
3. Uses existing Okta SSO—no separate login or credential management
4. Maintains complete audit trail of all searches and document access
5. Keeps data in the bank's environment—no data sent to public APIs

Technical challenges you must address:

1. **Authentication flow:** User authenticates via Okta → How does that identity propagate to ServiceNow, Workday, and the legacy compliance system?
2. **ACL synchronization:** Source systems have their own permission models—how do you translate these for search?
3. **Connector architecture:** No first-party connectors exist—you must build custom connectors for each system
4. **Token management:** How do you handle token exchange across different identity providers without storing long-lived credentials?
5. **Legacy system:** The compliance system uses LDAP+2FA with no OAuth—how do you integrate it securely?

Questions to address:

- Walk me through the complete authentication flow when a user performs a search
- How do you implement Workload Identity Federation to avoid storing credentials?
- How do you handle the Okta → Azure AD → ServiceNow token delegation chain?
- What happens if a document's permissions change after it's been indexed?
- How do you design audit logging that satisfies regulators?

Design the connector architecture and authentication flow. This is primarily a security and identity federation challenge—the search quality is secondary to getting access control right.

Your Audience

You, the domain specialist, have been engaged to build that architecture and present it to the customer's domain expert. You are presenting the validated proof-of-concept and final technical design to the **customer's domain expert (Technical Stakeholder)** and their **VP of Strategy (Business Stakeholder)**. Your interviewer will ask questions to represent both perspectives.

Your Presentation

We recommend your presentation to follow the layout and flow below. You are welcome to create a slide presentation, screen share, or use another format to showcase your solution. Your presentation is intended to be

covered in **30 minutes** with **10-15 minutes of Q&A regarding your presentation content**. The mock customer meeting should not exceed **45 minutes**, including interactions and questions from the “customer”.

- **Title & context:** Introductions and setting the stage for the specific practice scenario.
- **The specialized challenge:** Clearly define the “unblocker.” Why was an off-the-shelf solution impossible?
- **Technical deep-dive / live demonstration:** Show the custom code, scripts, or novel architecture used to resolve the challenge. Demonstrate your “hands-on” proficiency.
- **Architectural decisions & trade-offs:** Defend your design to the technical expert. Why this custom approach over others?
- **Business & strategic value:** Translate the technical win into ROI or competitive advantage for the VP of Strategy.
- **Implementation & next steps:** High-level roadmap for moving the prototype to production ramp.

Presentation Logistics

- **Important:** Be sure **not** to include confidential information in your presentation; including the name of the customer example being used. Avoid using logos, screenshots or imagery that could breach confidentiality. Please make the best decision based on your current workplace agreements.
- While our goal is to evaluate your ability to step into a Google Cloud CE role, this interview is not meant to be an exhaustive demonstration of your mastery of Google's product features or naming conventions. Please feel free to leverage your experience with other public cloud providers and products in the market as part of your presentation.
- You're welcome to use any presentation software (including but not limited to: Google Slides, PPT, Adobe, Prezi, Keynote). Please note that certain software may take over your entire presentation window. Be sure to practice presenting via [Google Meet](#) before your interview.
- Practice your presentation without your notes. You may use notes during your presentation, but know that if you share your screen, the interviewers may be able to see them.

Best Practices

- Build your presentation with simplicity and intention. The panel will assess verbal communication and presentation content and structure.
- We want this to be fun, not burdensome! The presentation should take no more than approximately four hours to prepare.
- Anticipate and prepare for questions you might be asked during and after you finish.
- Practice! Your delivery should be conversational but professional. Let your Recruiter know if you have any questions about your presentation format.
