User Prompt	Maximum 5 slides of a DEMO for Public Sector customers. I am thinking the outline should be something like - Framing the problem and how big it is - What is the current solution(s) - What is the problem with the current solutions - What if things could be different - DEMO The context is how Australia is a Multicultural Society. and we embrace all the languages and dialects that also means when some patients go to hospital for. care language interpretation may not be available all the time or at the most critical times there are some situations also where the caregivers are non-native English speakers and may not even speak English at all. And the opposite is true where the young children speak English very well and they act as the interpreters for their parents or grandparents. The DEMO is how Google can solve for this problem in a way that is human centered elevating the humanity and dignity of the patients and their care givers.

Practical AI for the Public Sector

Start with Impact

Move past the fear and the buzzwords. What does safe, personalized, and low-maintenance AI look like in the hands of government agencies and citizens? In this session we want to spark your ideas with a short, interactive demonstration, showing what is possible - and accessible - with AI today.

Demo

Department of Information and Comms Tech (DICT) & Google Cloud: Accelerating "Digital Philippines"

THE CHALLENGE

- **Linguistic Exclusion:** Manual translation of dense thousands of policies marginalized isolated and disadvantaged citizens due to lack of local dialects.
- **Information Bottlenecks:** Fragmented workflows and manual data silos delayed service response times.
- **Resource Drain:** IT staff resources wasted on repetitive, low-level support tickets instead of modernization.

THE SOLUTION

- **Gemini Enterprise Agentic Platform:** Equipped public servants to discover, create, and deploy custom AI agents.
- **Technical Discovery:** Mapped infrastructure directly to DICT's national digital strategy.
- **Seamless Procurement:** Listed Workspace on DBM e-Marketplace to enable rapid acquisition and eliminate friction.

THE IMPACT

- **Bridged Digital Divide:** Empowered isolated and disadvantaged communities with localized translation and conversational AI support.
- **AI-Driven Workflows:** Activated key use cases: knowledge base, translator, and intelligent procurement.
- **Trusted Advisor Status:** Shifted Google Cloud's role from a technology vendor to a high-value strategic partner.

What we have learned about AI success

There are five key challenges that organizations must overcome to successfully deploy AI

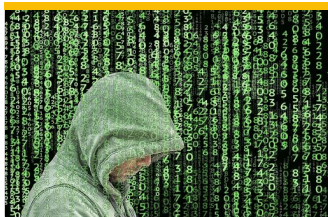

Unlocking disparate data sources

Data is often distributed across and locked within legacy systems

Accessing data needed to release value can be complex and means that it's hard to extract the strategic value and insights.

Ensuring security, compliance & privacy

You must keep control of your data, and protect your IP from leaks

Some AI systems use the data that you input and incorporate it into their models, potentially giving your insights to competitors.

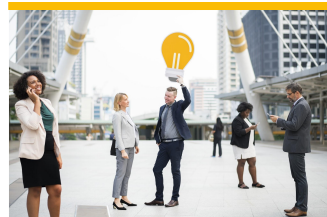

Reducing cost & complexity

Some AI systems use a mixed stack of components, making time to value complex and costly

Integrating varied systems and components directs valuable time away from creativity.

Driving innovation and efficiency

Often too much focus is placed on potential cost saving without also considering how to unleash creativity and future vision

AI is a strategic asset for your people to deliver the future potential of your organization.

It's a journey, not once-off

AI will continue to evolve

Implementing AI is an iterative process, with new data sources and opportunities emerging. It's critical your skills grow and develop to meet future needs.

Gemini Enterprise

Bring the best of Google AI to every Government Employee, for Every Workflow.

The Brains

Immediate access to Google's most advanced Gemini models

The Workbench

Gemini chat platform with tools for all employees to build, orchestrate & use agents

The Taskforce

A suite of specialized, Google-built & third-party agents from research to coding

The Context

All grounded in the reality of your own systems and data, wherever they live

and many more...

The Governance: A central place to visualize, secure, and audit all your agents
